## DETAILED ACTION

### *Claim Rejections - 35 USC § 102*

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

The changes made to 35 U.S.C. 102(e) by the American Inventors Protection Act of 1999 (AIPA) and the Intellectual Property and High Technology Technical Amendments Act of 2002 do not apply when the reference is a U.S. patent resulting directly or indirectly from an international application filed before November 29, 2000. Therefore, the prior art date of the reference is determined under 35 U.S.C. 102(e) prior to the amendment by the AIPA (pre-AIPA 35 U.S.C. 102(e)).

2. Claims 1-4 are rejected under 35 U.S.C. 102(e) as being anticipated by Talieh (6,676,822).
3. The Talieh patent is directed to a method for electrochemical deposition of a metal onto a semiconductor wafer. As shown in figures 1A and 1B, the wafer is positioned to face anode 30. This corresponds to the first step of instant claim 1. A pad 32 is positioned between the anode and wafer so that it contacts both. A plating liquid is supplied through openings in the anode plate to the pad. A cathode contact

28 provides plating current to the wafer. This corresponds to the second step recited in claim 1. As shown in figure 1A, both the wafer and pad rotate. The widths of the pad 32 and supporting portion of the anode are smaller than the diameter of the wafer. Consequently, as the pad and wafer rotate, the central portion of the surface of the substrate faces the anode for a longer time than the outer peripheral portion. This corresponds to the last step of claim 1. Thus, all limitations of claim 1 are taught by Talieh.

4. As shown in figure 1A and noted above, the substrate is moved by rotation. This meets the limitation of claim 2. The anode is also moved by rotation. This meets the limitation of claim 3. As shown in figure 4B, anode 214 may translate with respect to the substrate. This meets the limitation of claim 4.

5. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Broadbent (6,027,631) and Mayer et al (6,402,923) disclose electroplating methods in which an element is placed between the anode and workpiece in such a manner that the inner central portion of the workpiece is exposed to the anode for a longer time the outer peripheral portion, providing a uniform deposit.
